Аналіз продуктивності та перевірка цілісності

Аналогічно попереднім завданням, необхідно буде створити колекцію (таблицю) з каунтером лайків. Далі з 10 окремих клієнтів одночасно запустити інкрементацію каунтеру лайків по 10_000 на кожного клієнта з різними опціями взаємодії з MongoDB.

```
db.createCollection("users")
```

```
db.users.insertOne({ user_name: "User1", likes_count: 0 })
```

```
URI = "mongodb://mongodb-node1:27017,mongodb-node2:27018,mongodb-node3:27019/?replicaSet=lab4ReplicaSet"
client = MongoClient(URI)

db = client["lab4ReplicaSet"]
collection = db["counter"]
```

1. Вказавши у параметрах `findOneAndUpdate` `writeConcern = 1` (це буде означати, що запис іде тільки на Primary ноду і не чекає відповіді від Secondary), запустіть 10 клієнтів з інкрементом по 10_000 на кожному з них. Виміряйте час виконання та перевірте чи кінцеве значення буде дорівнювати очікуваному - 100K
